## **CEMENTATION OF PORCELAIN CROWN**

### ***Congratulations!!!***

You have just had your tooth permanently restored with a porcelain crown. Because we use the best materials and techniques available, we expect this restoration to give you many years of service.

The dental cement which bonds the crown to the tooth, hardens within minutes and you may immediately use the crown without fear of dislodging it.

Since it can be more difficult to keep the area around a crown healthy, thorough brushing and flossing is recommended.

The crown should immediately feel completely natural. If you notice ANY change in your bite, or any sensitivity that persists for more than two weeks, then please contact us immediately.

### **IF ANESTHETIC WAS ADMINISTERED**

Even though we make every effort to administer the local anesthetic in a painless and non-traumatic manner, you may still experience some tenderness in the area of the injection for the next 24-48 hours. For this reason we recommend you take an anti-inflammatory medicine after your appointment. ( Advil, or Motrin.)

As always, please call Dr. Khanna if you have any questions or concerns regarding your treatment.
